

Save Time & Money!

View, Rescale, Rotate and Print batches of Plot Files in minutes instead of hours!

Plot files are used for a variety of purposes. Many companies use plot files for archival reasons; some for sharing with clients or vendors without the headache of sending native CAD files; others for reducing the amount of paper output they generate.

CAD fx has now taken the most popular plot file formats and given its customers some truly great capabilities! If your company deals with large numbers of PDF, HPGL/2, DWF, and TIFF files, you can now...

- Batch print to any Windows system printer saving your company untold hours getting needed prints.
- View all four of these file formats with one program.
- Plot these files to virtually any scale. This is quite useful in the CAD world when scaling a drawing still matters!
- Rotate and invert files for best printing output.
- Monitor the status of printers and plotters
- Collate plots and order them for first-in-first-out or last-in-first-out.
- Save a set of plot files into a named group for later retrieval and printing.
- "QuickPrint" feature for quickly printing out a zoomed up area to in the file viewer.
- "Find" feature for tracking down a plot file name in a large directory
